HISTORY OF THE ORIGINAL

In 1901 the Oerlikon engineering works decided to undertake its first serious experiments with electricity on Swiss railways. It offered the SBB/CFF a test section from Seebach to Wettingen (19 km), to be built at its own expense on the existing line: an electrified test line was thus created on Swiss soil.

The trials with the Fc 2x2/2 no. 1, known as "EVA", proved promising, and the locomotive was soon put into regular service, albeit at first with some skepticism and apprehension on the part of passengers. An improved version of EVA followed shortly afterwards: locomotive no. 2, named "MARIANNLI", this time with a complete body. Thanks to their good results, both machines were taken over in 1919 by the SBB, which had meanwhile introduced electrification.

EVA was in service for a long time at Erstfeld depot. Rebuilt once more, it passed to the BT (Bodensee-Toggenburg) as Ce 4/4 no. 33. MARIANNLI was also later used by the STB (Sensetalbahn).

Crafted from brass following a meticulous study of historical archives, every Fulgurex model aims for fidelity down to the smallest detail, for the pleasure of seeing it come to life on your tracks.
